What Is This Project?

A **web application** built for an Egyptian travel agency (ITTravelers) as an internal sales tool. Used during one-on-one client calls via screen share to browse Bali travel packages — destinations, hotels, and tours — with honeymoon couples in real time.

The problem it solves: Before this app, agents had to jump between PDFs, spreadsheets, and partner websites during calls. This app puts everything in one clean, fast, branded interface.

Features

- Browse **Bali destinations** → **Cities** → **Hotels & Tours**
 - **Hotel cards** with cover photos, star ratings, room types, and photo links
 - **Tour cards** with category badges, cover photos, inclusions/exclusions toggle, up to 4 TikTok preview links
 - **Category filter** for tours: Romantic, Adventure, Cultural, Nature, Water, Nightlife, Beach Club
 - **Session selection** — add hotels and tours to a shortlist during the call (resets on refresh — intentional, no client data stored)
 - **Admin panel** at `/admin` — password protected, full CRUD for destinations, cities, hotels, and tours without touching code
 - **No prices shown anywhere** — discussed verbally during the call
 - Two tour operators in the same database: Beyond Bali Tours + Exotic Paradise Bali
 - Fully responsive, mobile-friendly design
 - Custom brand colors: terracotta, ivory, gold, dusty rose
-

Tech Stack

Technology	Role	Why
React 18	Frontend UI framework	Industry standard, component-based, fast
TypeScript	Type-safe JavaScript	Catches bugs before runtime
Vite	Build tool & dev server	Fastest React setup available
Tailwind CSS	Styling	No custom CSS files needed, utility classes
Supabase	Database + API (PostgreSQL)	No backend server needed, free tier
React Query (@tanstack/query)	Data fetching & caching	Handles loading/error states automatically
React Router v6	Client-side navigation	Multi-screen app without page reloads
Lucide React	Icons	Clean, consistent icon set
Vercel	Hosting & deployment	Free, auto-deploys from GitHub in 30 seconds
GitHub	Version control	Code history, connects to Vercel

Database Structure (Supabase / PostgreSQL)

5 tables:

destinations	→ Bali (country, cover photo, vibe description)
↓	
cities	→ Ubud, Seminyak, Canggu, Uluwatu, Nusa Penida, Sanur, East Bali, Gili Trawangan, North Bali
↓	
explorer_hotels	→ 43 hotels (star rating, chain, room types, photos)
explorer_tours	→ 68 tours (category, inclusions, exclusions, TikTok links)
tour_cities	→ many-to-many: links tours to multiple cities

Key SQL concepts used:

- `CREATE TABLE` with primary keys and foreign keys
- `ALTER TABLE` to add columns via migrations
- `INSERT` , `UPDATE` , `DELETE` statements
- `JSONB` columns for arrays (room types, inclusions, exclusions)
- Row Level Security (RLS) policies
- UUID primary keys

├── vercel.json                # SPA routing fix for Vercel
└── .env                       # VITE_SUPABASE_URL, VITE_SUPABASE_ANON_KEY, VITE_ADMIN_PASSW
```

How the App Flows

```
User opens app
↓
DestinationScreen – shows Bali with city area cards
```

↓
Click a city (e.g. Ubud)
↓
AreaScreen – shows hotels + tours for that city
↓
Click heart on hotel or tour → adds to session selection
↓
Session summary shows selected items (resets on refresh)

Deployment Flow

Write/edit code locally
↓
git commit + git push → GitHub
↓
Vercel detects the push automatically
↓
Vercel builds and deploys in ~30 seconds
↓
Live at ittravelers-system.vercel.app

Key Problems Solved During Build

Problem	Solution
Invalid UUID syntax in seed data	Changed prefixes from <code>t/c/d</code> to valid hex <code>e/b/a</code>
404 error on <code>/admin</code> route	Added <code>vercel.json</code> with SPA rewrite rule
Cover image column didn't exist	Ran <code>ALTER TABLE</code> migration in Supabase
Google Images URLs blocked	Switched to Unsplash direct URLs
Partner logo showing on tour links	Removed tour link buttons entirely from cards
Tour inclusions/exclusions display	Added expandable Details toggle to keep cards compact

What I Learned

- How to design and build a **full-stack web application** from scratch

- **Database design** — tables, relationships, foreign keys, migrations
 - **React components** — building reusable UI pieces
 - **TypeScript** — defining data shapes with interfaces
 - **Supabase** — setting up a database without a backend server
 - **Git & GitHub** — version control and code history
 - **Vercel** — deploying and hosting a web app
 - **Tailwind CSS** — building modern UI quickly
 - **SQL** — INSERT, UPDATE, DELETE, ALTER TABLE, JSONB arrays
 - How to iterate on a live product — adding features incrementally
-

CV / Portfolio Description

Option 1 — Short (for CV bullet point):

Built a full-stack internal sales tool for a travel agency using React, TypeScript, Supabase, and Vercel. Features include a multi-screen destination browser, hotel and tour catalog with admin panel, session-based client shortlisting, and a PostgreSQL database with 68 tours and 43 hotels across 9 Bali destinations.

Option 2 — Medium (for LinkedIn or portfolio):

ITTravelers Trip Explorer — A production web application built for an Egyptian travel agency to use during client sales calls. The app allows agents to browse Bali destinations, hotels, and tours on screen share with clients in real time. Built with React, TypeScript, Vite, Tailwind CSS on the frontend, and Supabase (PostgreSQL) as the backend database. Deployed on Vercel with automatic GitHub integration. Features include a full admin panel for content management, category-based tour filtering, expandable inclusions/exclusions, and a session-based shortlist system. This was my first software project built from scratch.

Option 3 — For portfolio website:

ITTravelers — Trip Explorer My first full-stack web project. An internal sales tool for a travel agency.

Tech: React · TypeScript · Tailwind CSS · Supabase · Vercel

Key features: Multi-screen destination browser · 43 hotels · 68 tours from 2 operators · Admin CRUD panel · Session shortlist · Mobile responsive

Live: ittravelers-system.vercel.app · **Code:** github.com/ashokryy1-hash/ittravelers-system
